NASA's MESSENGER spacecraft (MErcury Surface, Space ENvironment, GEochemistry and Ranging) was launched on August 2004 on a mission of discovery to our innermost planet. After two velocity adjusting flybys of Earth, one of Venus and three of Mercury, it became the first spacecraft to orbit Mercury on March 24, 2011.

In Roman mythology, Mercury was the god of commerce, transported on winged sandals. The British composer Gustav Holst characterized him as the winged messenger in his famous orchestral suite, The Planets, in 1916.

For more information on Mercury and the Messenger mission, come to McCarthy Observatory's Second Saturday Stars on January 14.

Orion Rules the Winter Sky
The Year of the Solar System

NASA announced on Oct. 7, 2010 that the upcoming year would be “The Year of the Solar System.” The “Year,” however, is a Martian year and, as such, 23 months in length. Some of the highlights of the “Year” of exploration are:

<table>
<thead>
<tr>
<th>Date</th>
<th>Mission</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>19 Nov 2010</td>
<td>Launch of O/OREOS, a shoebox-sized satellite designed to test the durability of life in space</td>
<td>Ground stations receiving data</td>
</tr>
<tr>
<td>19 Nov 2010</td>
<td>Launch of experimental solar sail (NanoSail-D)</td>
<td>Mission completed (successfully)</td>
</tr>
<tr>
<td>7 Dec 2010</td>
<td>Japan's Akatsuki (Venus Climate Orbiter) spacecraft</td>
<td>Spacecraft fails to enter orbit around Venus - now in orbit around the Sun</td>
</tr>
<tr>
<td>14 Feb 2011</td>
<td>Stardust NExT encounters Comet Tempel 1</td>
<td>Successful rendezvous; see <a href="http://stardustnext.jpl.nasa.gov/">http://stardustnext.jpl.nasa.gov/</a></td>
</tr>
<tr>
<td>17 Mar 2011</td>
<td>MESSENGER enters orbit around Mercury</td>
<td>First spacecraft to achieve orbit around Mercury; see <a href="http://messenger.jhuapl.edu/">http://messenger.jhuapl.edu/</a></td>
</tr>
<tr>
<td>18 Mar 2011</td>
<td>New Horizons spacecraft crosses the orbit of Uranus</td>
<td>4+ more years to Pluto; see <a href="http://pluto.jhuapl.edu/">http://pluto.jhuapl.edu/</a></td>
</tr>
<tr>
<td>05 Aug 2011</td>
<td>Launch of the Juno spacecraft to Jupiter</td>
<td>Successful launch/deployment; see <a href="http://solarsystem.nasa.gov/grail/">http://solarsystem.nasa.gov/grail/</a></td>
</tr>
<tr>

</tr>
</tbody>
</table>

Other notable events:
- August 9, 2011 Opportunity reached the rim of Endeavour crater
- March 3, 2012 Mars at Opposition
- May 20, 2012 Annular Solar Eclipse (visible in southwest U.S.)
- June 6, 2012 Venus Transit (visible before sunset on the east coast)
It’s been 39 years since we left the last footprint on the dusty lunar surface. Sadly, as a nation founded on exploration and the conquest of new frontiers, we appear to have lost our will to lead as a space-faring nation. But, what if the average citizen had the means to visit our only natural satellite; what would they see out the window of their spacecraft as they entered orbit around the Moon? This column may provide some thoughts to ponder when planning your visit (if only in your imagination).

The view this month is of the northern reaches of Mare Humorum (Sea of Moisture) and the magnificent impact crater Gassendi. Large enough to be classified as a walled plain, Gassendi is 55 miles in diameter. The walls of the crater appear as segments of an arc or polygon rather than a continuous ring. The central peaks, catching the rising sun, rise 4,000 above the darkened fractured floor. The second photo shows the entire crater bathed in sunlight with the terminator advanced further to the west.

Mare Humorum is approximately 275 miles across and fills an ancient impact basin created 3.9 billion years ago. Mare lavas are estimated to be over a mile and one-half deep near the center of the basin. One potential source of the lava is a sinuous rille or winding channel located just north of the mare. Rimae Herigonius appears to start with a pit in the Ewing ridge. The 1,600 foot wide channel meanders east, then west, before heading south through the “pillars.”

Lunar "seas" and "oceans" are actually expansive low-lying plains formed by ancient lava flows
January History

The month of January has been a difficult one for both the American and Soviet space programs. Untimely deaths set back both the American and Soviet moon programs. The two space shuttles that have been lost were also launched in January.

Sergei Korolyov, the “Chief Designer” of the Soviet space program, died on January 14, 1966 from a botched medical procedure. Korolyov co-founded the Moscow rocketry organization in the 1930s before being thrown into prison during the peak of Stalin’s purges. He spent a year in the Kolyma gold mine, the most dreaded part of the Gulag in Siberia before he was recalled to Moscow to aid the Red Army in developing new weapons. Korolyov went on to lead the Soviet space effort. Unfortunately, the Soviet Moon program died with Korolyov in 1966. While the race continued for some time after his death, his N-1 moon rocket never made a successful flight.

In January of 1967, after a successful Gemini program, NASA was moving forward with testing the new Apollo spacecraft. On the afternoon of the 27th, Gus Grissom, Ed White and Roger Chaffee were sealed inside the Apollo 1 command module sitting on top of an unfueled Saturn rocket in a simulated countdown. The command module had been plagued with problems and was in a state of constant redesign. At 6:31 pm, a spark from a damaged wire ignited the pure oxygen atmosphere in the spacecraft. Within seconds the temperature reached 2,500°F. The astronauts never had a chance to undo the bolts of the hatch before they were asphyxiated. Following their deaths, the spacecraft was completely redesigned. Lessons learned from this accident served to make the spacecraft much safer and contributed to the success of the six moon landings.

Twenty-two years ago, on January 28, 1986, the United States lost its first space shuttle, the Challenger. Due to the low temperature on the launch pad, a rubber-like O-ring used to seal the joints of the solid rocket boosters failed to seat and stop the hot gasses from escaping. The gas produced a blowtorch-like flame that penetrated the external tank filled with liquid oxygen and hydrogen. The tank exploded 73 seconds after liftoff, destroying the shuttle and killing all seven crew members. Among the crew was Christa McAuliffe, a New Hampshire teacher.

Christa graduated from Framingham State College (Framingham, Massachusetts) in 1970. Following her death, the college established The Christa McAuliffe Center on the campus as a means to continue the educational mission which was Christa’s life’s work.

On February 1, 2003, a second space shuttle, the Columbia, was lost. The Columbia was the oldest shuttle in the fleet, having been first flown in 1981 by astronauts John Young and Robert Crippen. On its 28th flight, Columbia broke apart during reentry at an altitude of some 200,000 feet and a speed of 12,500 miles per hour. The shuttle and its crew of seven had just completed a 16 day science mission. The most likely cause of the accident was damage to a seal on the left wing from a piece of insulating foam that broke loose from the external fuel tank at launch, striking the wing. The resulting gap in the wing allowed the superheated atmosphere to penetrate the wing during reentry and destroy the spacecraft.

The Columbia accident ultimately led to the decision to stop flying the space shuttle once the International Space Station was complete and to develop a safer manned vehicle.

Goldilocks Planet

NASA confirmed on December 5th that the Kepler telescope had discovered its first planet located within the habitable zone (also known as the Goldilocks zone) around a star similar to our sun. The habitable zone is the region around a star where liquid water can exist.

The planet, known as Kepler-22b, is the first of ten near Earth-sized candidates that are located in a habitable zone to be confirmed.

http://www.mccarthyobservatory.org
Kepler-22b is 2.4 times larger than the Earth. The planet orbits its star in 289 days. Its star is slightly smaller and cooler than our sun.

The Kepler telescope discovers planets by the transit method: measuring the small dip in brightness as the planet crosses in front of the star. Three transits are required for confirmation.

**Private Progress**

With the retirement of the space shuttle, NASA is relying upon private industry to develop the capabilities to supply the International Space Station with cargo and replacement crews. Two of the contenders are Space Exploration Technologies or Space X and Orbital Sciences Corporation. The companies are expected to launch demonstrations in the next few months.

**Space X**

Space X is developing the Dragon spacecraft to carry both crew and cargo into low Earth orbit. The reusable capsule is launched aboard its Falcon 9 rocket. Space X is scheduled to launch its second Dragon spacecraft in February from the Cape Canaveral Air Force Station. However, the mission is still pending final approval by NASA and the other ISS partners (most notably Russia) that are concerned with untested space-
craft conducting maneuvers in the vicinity of the ISS. The mission is designed to demonstrate rendezvous tech-
iques with the ISS, and the Dragon spacecraft could
dock with the ISS with the assistance of the ISS’s ro-
botic arm.

**Orbital Sciences**

Orbital Sciences is also scheduled to launch a dem-
stration of its Cygnus spacecraft in February. The
cargo carrying spacecraft will be carried into low-Earth
orbit by the company’s Taurus II rocket (recently re-
named Antares) from its launch facility on Wallops Is-
land, Virginia.

The Taurus II is an expendable, two stage rocket.
The first stage is powered by two NK-33 rocket
engines. The kerosene and liquid oxygen powered
engines were originally designed and built by the
Kuznetsov Design Bureau for the Soviet N-1 moon
rocket and refurbished/updated by GenCorp Aerojet.

**January Nights**

January nights can be clear and cold with frigid blasts
of polar wind. They also present an opportunity to see
stars at every stage in their life cycle, from birth (Orion
Nebula) to fiery demise (Crab supernova remnant).

If you are out observing the open star clusters Pleia-
des or Hyades in the constellation Taurus, don’t over-
look the red giant Aldebaran. This star is receding from
us more rapidly than any other 1st magnitude star in the
sky. It was the brightest star in the sky some 320,000
years ago when it was 21½ light years from Earth.
Moving away, Aldebaran is currently 65 light years in
distance and the thirteenth brightest star in the sky.

**Sunrise and Sunset**

**Astronomical and Historical Events**

1st | First Quarter Moon
1st | GRAIL-B spacecraft enters lunar orbit
1st | History: Giuseppe Piazzi discovers the first asteroid, now dwarf planet, Ceres (1801)
2nd | Flyby of Saturn’s largest moon Titan by the Cassini spacecraft
2nd | History: launch of the Soviet spacecraft Luna 1; first probe to fly by the Moon (1959)
3rd | Quadrantids meteor shower peaks; radiates from the constellation Boötes (name from an obsolete con-
stellation called Quadrans Muralis)
3rd | History: exploration rover Spirit lands on Mars in Gusev Crater; operational for six years before getting
bogged down in loose soil at a winter haven called Troy (2004)
3rd | History: Stephen Synnott discovers Uranus’ moons Juliet and Portia (1986)
4th | Earth at Perihelion; closest approach to the Sun (0.983 AU)
4th | Distant flyby of Saturn’s moons Helene, Mimas and Janus by the Cassini spacecraft
4th | History: Isaac Newton born; inventor of the reflecting telescope, described universal gravitation, com-
piled the laws of motion, and invented calculus (1643)
5th | Moon at Apogee (furthest distance from Earth)
5th | History: discovery of Jupiter’s moon Elara by Charles Perrine (1905)
6th | History: La Criolla (Argentina) meteorite fall (1985)
7th | History: discovery and first recorded observations of Jupiter’s four largest moons by Galileo Galilei (1610)
8th | History: launch of Japanese spacecraft Sakigake with mission to rendezvous with Comet Halley; mea-
sured the solar wind and magnetic field (1985)

Astronomical and Historical Events (continued)

25th History: launch of the U.S. Moon orbiter Clementine (1994)
25th History: Joseph Lagrange born; mathematician who discovered five special points in the vicinity of two orbiting masses where a third, smaller mass can orbit at a fixed distance from the larger masses. The L1 Lagrange Point of the Earth-Sun system is the current home of the Solar and Heliospheric Observatory Satellite (SOHO).

26th History: discovery of Saturn’s moon Epimetheus by the Voyager 1 spacecraft (1980)
27th History: fire in the Apollo 1 spacecraft kills astronauts Gus Grissom, Edward White and Roger Chaffee (1967)
27th History: Philibert Melotte discovers Jupiter’s moon Pasiphae (1908)
28th History: final launch of the space shuttle Challenger (STS-51L); lost on lift-off (1986)
28th History: Johannes Hevelius born; leading observational astronomer of the 17th century, published detailed maps of the moon and determined the rotational period of the sun (1611)

30th First Quarter Moon
30th Scheduled flyby of Saturn’s largest moon Titan by the Cassini spacecraft

31st History: launch of Apollo 14; third manned moon landing with astronauts Alan Shepard, Stuart Roosa and Edgar Mitchell (1971)
31st History: launch of Soyuz Moon lander Luna 9; first spacecraft to land and to transmit photographs from the Moon’s surface (1966)
31st History: launch of Mercury-Redstone 2 rocket with Ham the chimpanzee (1961)
31st History: launch of the first U.S. satellite, Explorer 1; detected inner radiation belt encircling the Earth (1958)

References on Distances

• The apparent width of the Moon (and Sun) is approximately one-half a degree (½°), less than the width of your little finger at arm’s length which covers approximately one degree (1°); three fingers span approximately five degrees (5°)
• One astronomical unit (AU) is the distance from the Sun to the Earth or approximately 93 million miles

International Space Station/Space Shuttle/Iridium Satellites

Visit www.heavens-above.com for the times of visibility and detailed star charts for viewing the International Space Station, the Space Shuttle (when in orbit) and the bright flares from Iridium satellites.

Solar Activity

For the latest on what’s happening on the Sun and the current forecast for flares and aurora, check out www.spaceweather.com.
